The molecular theory of magnetism was given by Weber and modified by Ewing. According to this theory: Each and every molecule of a magnetic substance is a complete magnet in itself, having a north pole and a south pole of equal strength. In an unmagnetized substance, the molecular magnets are randomly oriented such that they form closed chains.

Molecular Orbital Theory. • For example, when two hydrogen atoms bond, a  $1s$  (bonding) molecular orbital is formed as well as a  $1s^*$  (antibonding) molecular orbital. • The following slide illustrates the relative energies of the molecular orbitals compared to the original atomic orbitals.
